All the information should be in the report, dated May 30, 2013, I sent you a couple of days ago, but it's attached here for Brad's benefit. I have not looked at very much of the report, but what I have seen looks like the street department's consultant is attributing the TCE it detected to Amphenol (see page 12 of 180).

Thanks.

When you get a chance, we would like more details about the release and the extent of plume migration.

I need to clarify a statement I passed along yesterday. The street department site, which is located southwest of Amphenol, was the location of a LUST cleanup that had 19 ppb of TCE in the groundwater. PCE was not found there.
